

Amendments to the Specification:

Please add the following new paragraph at page 21, after line 3:

01 A synchronization server database holds the equivalent of the handheld device database for each physician. Some data can be considered global across the hospital. There is no reason to keep these tables separate for each physician. However, separate patient records must be kept for each doctor. Even if two physicians are seeing the same patient, the notes field would be individual to the physician. Also separate billing card data must be maintained for each physician. Billing code data must also be separate for each physician since the system updates billing codes and guidelines on a per-physician basis.
